Ok, I'm not sure if this is the right way to do it, but I'll try to explain it as best as I can. The first step is to identify the problem. In this case, it's a simple arithmetic problem involving the calculation of the area of a rectangle. The dimensions of the rectangle are given as 10cm by 20cm, and the thickness of the material is 2.5cm. The goal is to calculate the volume of the material, which is simply the area of the rectangle multiplied by the thickness. The formula for the area of a rectangle is $A = l \times w$, where l is the length and w is the width. In this case, $l = 10\text{cm}$ and $w = 20\text{cm}$, so $A = 10 \times 20 = 200\text{cm}^2$. The volume V is then $V = A \times t$, where t is the thickness. So $V = 200 \times 2.5 = 500\text{cm}^3$. The final answer is 500 cubic centimeters.
